CASE STUDY:

HiTrust S.R.L.: Network security improved

The HiTRUST SRL, an Italian specialist in information security from Pescara in central Italy, advises companies on issues of information security, provides services related to data and network management as well as cloud services for data storage. In more than 35 customer networks throughout Italy HiTRUST has already implemented firewalls and other monitoring and protection systems. In doing so, the security service provider fends off hundred cyber attacks annually.

In order to control the surveilled IT infrastructures and networks, HiTrust has now installed a central control room in Pescara. The surveilled IT structures and the security situation are displayed centrally and in real time on and six single 46'' LCD displays of the type EYE-LCD-4600-SN-V2 by eyevis. Around the clock, 12 operators manage network structures and monitor access rates, network utilization as well as storage capacities. In doing so, the HiTrust employees are able to react quickly and coordinated on cyber attacks in order to fend off the attacks. Additionally, network management tasks can be performed centrally.

What is more, the eyevis LCDs offer a reliable technology for the secure display of all incoming data. The high brightness of 500cd/m² and the large contrast of 3000:1 offer the best image quality even with bright ambient light. An automatic ambient light sensor automatically adjusts the screen brightness to the ambient light. This way, with an automatic dimming it is possible to save electricity in night operation. As the displays operate around the clock and in that process also show static content, several features to prevent image sticking were incorporated.
